Name _____

In class today, we discussed what are the characteristics of a learned person.

For this game you are to reflect on what is knowing?

"When do you know that you know something? What are the signs that you know something well?"

To me when you really know something you know it from a level that means you can apply it to different situations. I view knowing something more as a mind set rather than being able to list off data or random information. Such as calculus, many people probably know the formulas without knowing how they were derived and why they work the way that they do. Once you understand something you can apply it to subjects that seem completely different because it is a way of thinking in the subject rather than just knowing. Programming has completely different knowledge from electrical engineering, but they are similar in the ways that parts are abstracted into systems like functions.
